

01 – Brainstorming and Ideation

Project Title

Auto Ticket Classification using Flow Designer

Team

Team Leader: A. Vithya

Team Members: K. Thanalakshmi, K. Theeshaya

Problem Identification

Service desks receive incidents with different descriptions and requirements. Manual classification can take time and may lead to inconsistent category, subcategory, or assignment decisions.

Brainstorming Ideas

1. Keyword-based classification. 2. Category and subcategory automation. 3. Automatic assignment to support groups. 4. Notification after classification. 5. Flow Designer-based automation.

Selected Idea

Build a ServiceNow Flow Designer automation that triggers when an incident is created or updated, evaluates incident information, classifies the ticket using defined rules, and updates the incident automatically.

Expected Outcome

Reduce repetitive manual classification work, improve consistency, and route incidents to the appropriate support area.
