

02 – Requirement Analysis

Project Title

Auto Ticket Classification using Flow Designer

Functional Requirements

- Trigger when a new Incident is created.
- Read the incident short description and description.
- Identify a classification using predefined rules.
- Update Category and Subcategory.
- Route the incident to an appropriate assignment group when configured.
- Preserve an Unknown/Other path when no rule matches.

Non-Functional Requirements

- Simple configuration and maintainability.
- Consistent classification.
- Traceable flow execution.
- Avoid unnecessary manual processing.

Inputs

Incident number, short description, description, category/subcategory fields, and other available incident attributes.

Outputs

Classified incident, updated category/subcategory, optional assignment group, and flow execution result.

Constraints

Classification quality depends on the rules defined by the project team. Ambiguous tickets may require manual review.
