

03 – Project Design

Project Architecture

ServiceNow Incident → Flow Designer Trigger → Classification Logic → Decision/Rule Branch → Update Incident → Optional Assignment/Notification.

Workflow

When an incident is created, the flow reads the incident details. Decision branches check configured keywords or conditions. A matching branch sets the relevant category/subcategory and optional assignment group. If no branch matches, the incident follows a default manual-review path.

Example Classification Rules

Password/reset keywords → Inquiry/Access-related classification.

Email/mailbox keywords → Email-related classification.

Network/Wi-Fi keywords → Network classification.

Hardware/laptop/desktop keywords → Hardware classification.

No match → Other/Manual Review.

UI Design

The Incident form remains the primary user interface. Automation updates the classification fields without requiring the user to perform repetitive classification steps.

Design Principle

Keep classification rules explicit, readable, and easy to modify in Flow Designer.
