

05 – Project Development

Implementation Overview

The solution is implemented using ServiceNow Flow Designer. The flow starts from an Incident trigger and uses decision logic to classify tickets.

Flow Structure

Trigger: Incident created.

Get/read incident data as needed.

Decision: evaluate classification rules.

Action: update Incident fields.

Optional Action: assign group or send notification.

Flow Designer Components

Trigger, Flow Logic/Decision, Update Record action, and optional notification or assignment actions.

Configuration Example

Rule 1: description contains password/reset → Access-related classification.

Rule 2: description contains email/mailbox → Email classification.

Rule 3: description contains Wi-Fi/network → Network classification.

Rule 4: description contains laptop/desktop → Hardware classification.

Else → Other/Manual Review.

Development Evidence

Store Flow Designer screenshots under Flow-Screenshots, configuration screenshots under Configuration, and any reusable action documentation under Actions.
