

07 – Detailed Project Documentation

Abstract

Auto Ticket Classification using Flow Designer is a ServiceNow automation project designed to reduce repetitive manual incident classification. The solution evaluates incident information and applies predefined classification rules.

Objectives

Automate ticket classification, improve consistency, reduce repetitive work, and provide a maintainable Flow Designer implementation.

Existing System

In a manual process, service desk users or agents inspect incident details and select classification fields themselves.

Proposed System

A Flow Designer workflow evaluates incident information and updates classification fields automatically according to configured rules.

Modules

Incident Trigger Module; Classification Decision Module; Incident Update Module; Optional Assignment/Notification Module; Testing and Monitoring Module.

Benefits

Faster repetitive processing, consistent application of rules, easier routing, reduced manual data entry, and clearer automation evidence.

Future Enhancements

Use a larger rule library, data-driven classification tables, integration with knowledge articles, advanced text analysis, confidence-based manual review, and reporting on classification accuracy.

Conclusion

The project demonstrates how ServiceNow Flow Designer can automate a repeatable Incident classification process using transparent business rules.
