

08 – Project Demonstration

Demo Objective

Demonstrate creation of an incident, automatic execution of the Flow Designer flow, and the resulting classification.

Demo Sequence

1. Open the Incident form.
2. Create a new incident with a classification-related description.
3. Save the incident.
4. Show that the flow is triggered.
5. Open the flow execution/details if available.
6. Return to the Incident and show updated classification fields.
7. Repeat with another category and one unmatched example.

Demo Script

This project uses Flow Designer to automatically classify ServiceNow incidents. When an incident is created, the flow reads the incident details, checks predefined rules, and updates the classification fields. Matching incidents follow their corresponding branch, while unmatched incidents use the default review path.
